

Container with Adhesive Seal Tapes

Abstract

A container formed from a preformed blank with four side walls and plurality of flaps on top and bottom of the container has plurality of adhesive tapes attached on the surfaces to assemble and seal the container without cutting off a piece of tape from a separate seal tape. The adhesive tape comprises three zones: two side zones with pressure-sensitive adhesive coating on the surfaces and one middle zone without adhesive coating in the middle of and adjacent to the two side zones. The middle zone of the adhesive tape is delimited by two perforation lines or breaking-off lines between the third zone and the two side zones. One side zone is attached to a surface of the container and the other side zone is covered with a protective strip in the fabricating process. When a user assembles and seals the container, the user peels off the protective strip on the side zone and presses against another surface of the container. When the user wants to open the container, without using a box cutter or a tool, the user can hold a tab at the end of middle zone and tear off the middle zone of the adhesive tape. Pluralities of adhesive tapes are attached to the

same locations on the container so the container can be reused multiple times.
